

Canmore Oats

Canmore is a tall growing medium maturing oat with very good standability. Its grain yield should be very competitive in cooler climates. It is also an excellent straw producer along with a high forage yielder.

Harvest Stages: At boot stage (Feekes Stage 10), Canmore is highest in crude protein and in percent digestible fiber. Harvest by stage 10 or quality will drop significantly with heading.

Management Notes:

Adequate seed bed preparation is important as are seeding rate and fertility.

Always test small grain forages for nitrate levels before feeding, especially when grown in high nitrogen regimes.

At A Glance

- Medium maturity
- Competitive grain yield and good forage yielder
- Good straw oat

Uses

Like other oats varieties, mixes well with alfalfa as a nurse crop to suppress weeds and protect from harsh weather

Dry Hay: Poor

Haylage/Balage: Excellent

Management Intensive Grazing: Good

Establishment

Planting Dates: Seed 4 to 6 weeks prior to the beginning of wheat seeding in fall, or early spring.

Seeding Rate: 95-130 lbs/A (3-4 bu/A)

Large seed box required.

Depth: 1" - 1 1/2"
