

# Fojtan Festulolium

## Robust and persistent

Fojtan is the result of a cross between Italian ryegrass and tall fescue. The appearance of Fojtan is much like tall fescue, and the two species share many properties: very high yield potential in combination with high persistence and tolerance to drought and periodic flooding. The main advantage of Fojtan is the improved feeding value.

## Forage quality

The feeding value (energy concentration of Fojtan) is in between tall fescue and perennial ryegrass. In a mixture with ryegrasses and/or white clover, Fojtan will deliver good forage suitable for most classes of livestock.

## Good for grazing

With its medium-late maturity, Fojtan is well-suited for grazing and a perfect partner in mixes with intermediate diploid perennial ryegrass. Fojtan contributes persistence and drought tolerance.

## At A Glance

### Key Features

- Tall fescue type festulolium
- Long-lived
- Heat and drought-tolerant
- Improved nutritional value over tall fescue along with excellent yield
- Suitable for grazing

### Establishment

Use the large box of the drill

### **Seeding rate:**

30-40 lbs/acre
