

# Montech 4193 Grain Pea

A semi-leafless, erect yellow grain pea that can also be used as a forage. Blocky structure and medium maturity with excellent yield.

High-protein forage for grazing or haylage/baleage, but supplement with hay or plant in a mix with oats, spring triticale, or spring barley for added effective fiber and a slower rate of passage. Alone, the feed value is comparable to alfalfa haylage. Large leaves and excellent palatability.

Peas can do well on a variety of well-drained soils with approximately neutral pH.

## Cutting Management

If planted with a small grain, harvest when the grain is at boot stage for best quality. Otherwise, harvest at flowering. Pea grain can also be harvested and ground to replace protein like soybean meal.

**Must be inoculated with pea/vetch inoculant.**

## At A Glance

- Semi-leafless, erect yellow grain pea
- Medium maturity
- High tonnage and highly palatable
- High grain yields
- Recommended in a mix with oats or spring barley or triticale to add effective fiber
- Grows best in cool weather,

## Best Uses

Haylage, baleage

## Establishment

**Seeding Rate:** 75-100 lbs/A

**Seeding Depth:** 3/4" - 1", Large box

**Seeding Dates:** Early spring or late summer
